

## Unit 2: Probability and distributions

### 1. Probability and conditional probability

STA 104 - Summer 2017

Duke University, Department of Statistical Science

Prof. van den Boom

<http://www2.stat.duke.edu/courses/Summer17/sta104.001-1/>

Slides posted at

- ▶ Piazza – Use regularly (post questions, answer others, read answers)
- ▶ Get started on PS 2, due Friday 12.30pm

1

### Readiness assessment

- ▶ 15 minutes individual – Sakai quiz, webcam on
- ▶ 10 minutes team – Also Sakai quiz but discuss in breakout sessions

### 1. Disjoint and independent do not mean the same thing

- ▶ *Disjoint (mutually exclusive) events* cannot happen at the same time
  - A voter cannot register as a Democrat and a Republican at the same time
  - But they might be a Republican and a Moderate at the same time – *non-disjoint events*
  - For disjoint A and B:  $P(A \text{ and } B) = 0$
- ▶ If A and B are *independent events*, having information on A does not tell us anything about B (and vice versa)
  - If A and B are independent:
    - $P(A | B) = P(A)$
    - $P(A \text{ and } B) = P(A) \times P(B)$

## 2. Application of the addition rule depends on disjointness of events

- *General addition rule:*  $P(A \text{ or } B) = P(A) + P(B) - P(A \text{ and } B)$
- A or B = either A or B or both

### disjoint events:

$$\begin{aligned} P(A \text{ or } B) \\ &= P(A) + P(B) - P(A \text{ and } B) \\ &= 0.4 + 0.3 - 0 = 0.7 \end{aligned}$$

### non-disjoint events:

$$\begin{aligned} P(A \text{ or } B) \\ &= P(A) + P(B) - P(A \text{ and } B) \\ &= 0.4 + 0.3 - 0.02 = 0.68 \end{aligned}$$

4

## 3. Bayes' theorem works for all types of events

- *Bayes' theorem:*  $P(A | B) = \frac{P(A \text{ and } B)}{P(B)}$
- ... can be rewritten as:  $P(A \text{ and } B) = P(A | B) \times P(B)$

### disjoint events:

- We know  $P(A | B) = 0$ , since if B happened A could not have happened
- $P(A \text{ and } B)$   
 $= P(A | B) \times P(B)$   
 $= 0 \times P(B) = 0$

### independent events:

- We know  $P(A | B) = P(A)$ , since knowing B doesn't tell us anything about A
- $P(A \text{ and } B)$   
 $= P(A | B) \times P(B)$   
 $= P(A) \times P(B)$

## Summary of main ideas

### Application exercise: 2.1 Probability and conditional probability

See the course website for instructions.

1. Disjoint and independent do not mean the same thing
2. Application of the addition rule depends on disjointness of events
3. Bayes' theorem works for all types of events
